

Directions: Find out when  $f(x)$  is inc and when  $f(x)$  is dec.

$$f(x) = 3 \cos(x) - \sqrt{3} \sin(x) \text{ on } [0, 2\pi]$$

$$f'(x) = -3 \sin(x) - \sqrt{3} \cos(x) = 0$$

$$-3 \sin(x) = \sqrt{3} \cos(x)$$

$$\frac{\sin(x)}{\cos(x)} = -\frac{\sqrt{3}}{3}$$

(try different angles till you get what you want)

$$\text{reference angle} = x = \frac{\pi}{6} = 30^\circ \text{ b/c}$$

$$\frac{\sin\left(\frac{\pi}{6}\right)}{\cos\left(\frac{\pi}{6}\right)} = \frac{\sin(30^\circ)}{\cos(30^\circ)} = \frac{\frac{1}{2}}{\frac{\sqrt{3}}{2}} = \frac{1 \cdot \sqrt{3}}{\sqrt{3} \cdot \sqrt{3}} = \frac{\sqrt{3}}{3}$$

Now, find the quadrants where  $\frac{\sin(x)}{\cos(x)}$  is neg

$\sin(+)$	$\sin(+)$
$\cos(-)$	$\cos(+)$
$\sin(-)$	$\sin(-)$
$\cos(-)$	$\cos(+)$

$$x = 150^\circ, 330^\circ$$

$$\text{so, } x = \frac{5\pi}{6}, \frac{11\pi}{6}$$

0	$\frac{5\pi}{6}$	$\pi$	$\frac{11\pi}{6}$	$2\pi$
$\frac{\pi}{6}$				4th quad.
-		+		-

$f(x)$  is inc on  $\left[\frac{5\pi}{6}, \frac{11\pi}{6}\right]$  b/c  $f'$  is +.

$f(x)$  is dec on  $\left[0, \frac{5\pi}{6}\right], \left[\frac{11\pi}{6}, 2\pi\right]$  b/c  $f'$  is neg.
